

Creighton University Parking Structures 1 and 2 Omaha, Nebraska

Two parking structures now occupy the corners of 24th and Burt Streets and 20th and Cass Streets on the Creighton University campus. Each structure is stair-stepped into the hillside, using the existing slope for on-grade access to each of the levels. Vehicle access is available from grade to each elevated deck by taking advantage of the naturally occurring slope of the sites.

The structures are steel frame with post-tension slab and a precast concrete exterior. This type of structure was chosen for speed of construction and security. The relatively light steel structure allowed for more open and exposed structure to create a more secure environment. The structures' combined capacity is approximately 1,075 vehicles. The team approach to the project allowed for an 18-month schedule from inception to completion.
